# Change of feed vs bird needs

Needs	Age	mg / bird / day	D Lys in feed (%)	Feed intake (gr/bird)
D Lys	31	792	0.75	106
	53	831	0.72	115

- What does it happen if feed intake doesn't increase?
  1. Drop of body weight
  2. Lost of feathers
  3. Increase of unspecific mortality
  4. Lost of production

# Needs of AA might needs a review

	H&N	CVB	Leeson and Summers	Fedna	Rostagno 2017
Lysine	100	100	100	100	100
Methionine	50	53	51	49	54
M+C	90	93	88	87	97
Threonine	69	66	80	70	80
Tryptophan	21	19	21	20	23
Arginine	104	-	103	110	96
Valine	88	86	89	98	93
Isoleucine	79	79	79	85	78

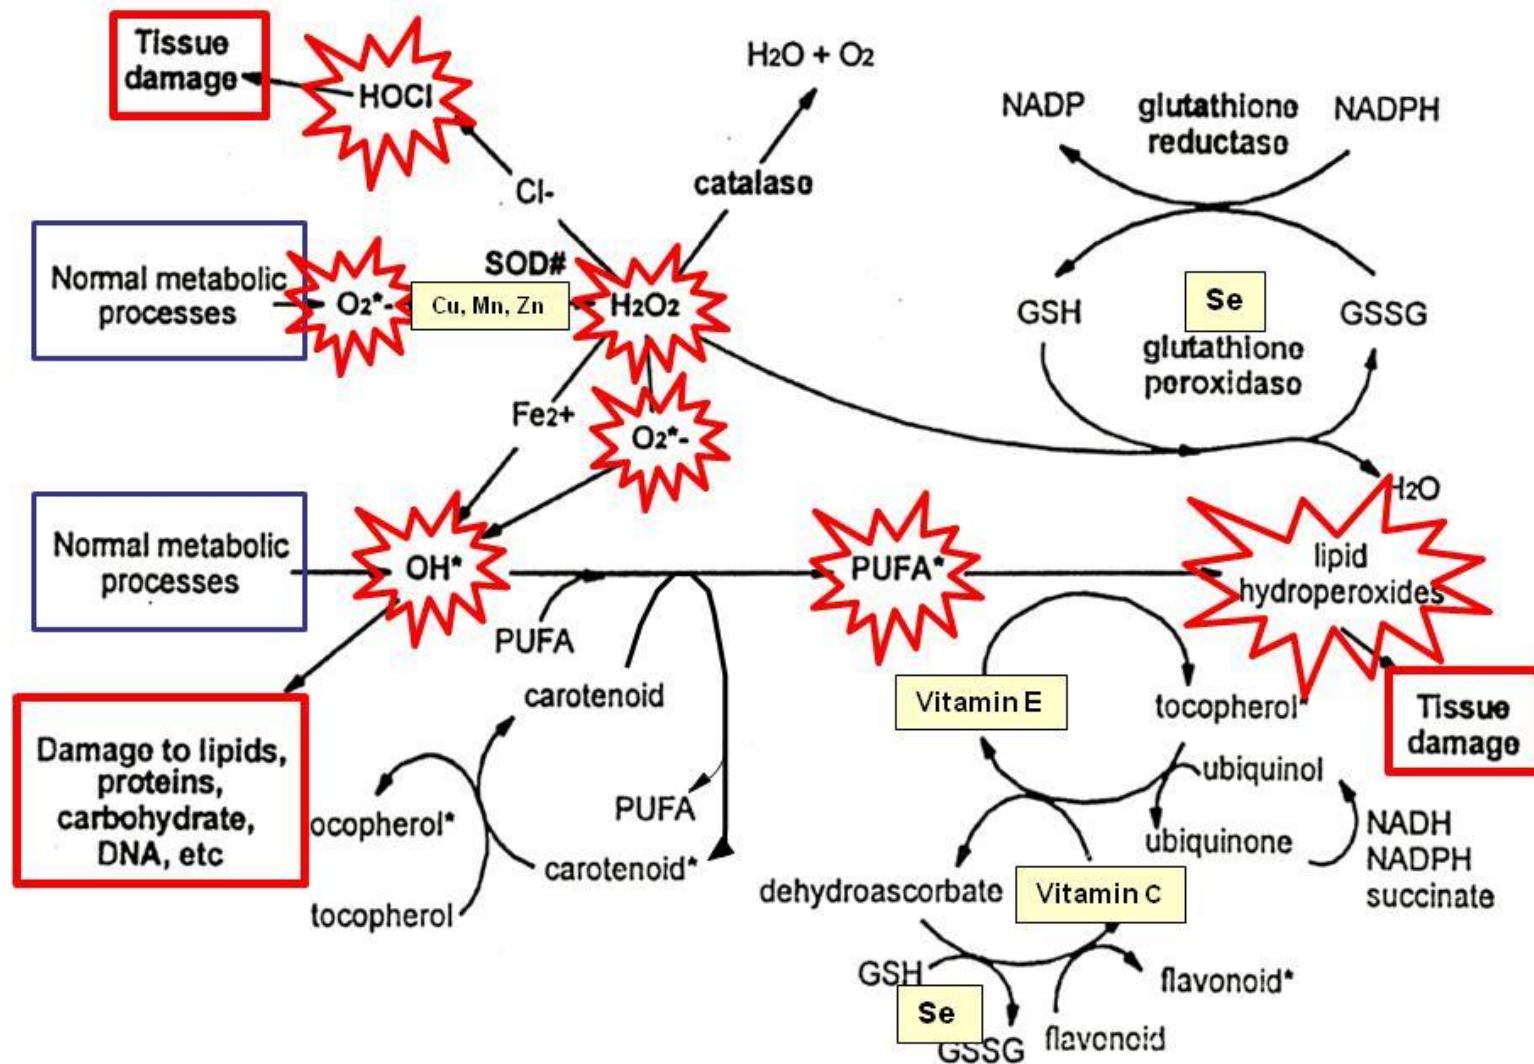

# Factors of oxidative stress

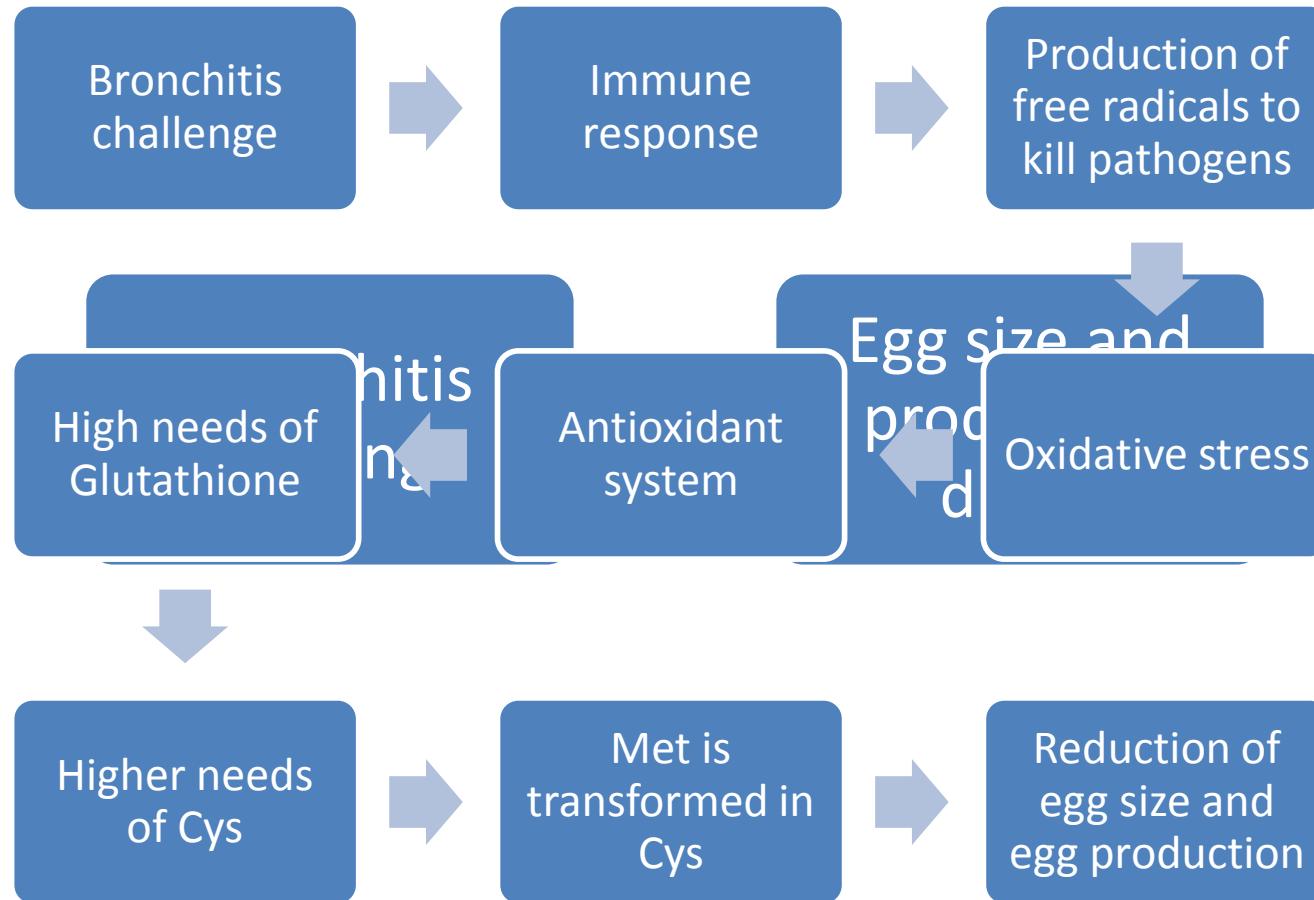

- High metabolic rate
- Diseases
- Heat stress and cold temperature
- Ammonia
- Diet: unsaturated fats and mineral and vitamins deficiencies

# Antioxidant system

# Oxidative stress example

# Tryptophane

- There is a correlation between the levels of Trp and the levels of serotonin in poultry
- Lack of serotonin is linked with aggressive behaviors
- Increasing the ratio from 18% up to 29% reduces the incidence of feather pecking  
(Evonik 2015)

# Fiber

- Traditional view:
  - Reduces feed intake
  - Reduces digestibility
  - Increases viscosity and pathogens growth
- New views
  - Type, level, size and sources in the diet can show a very different results

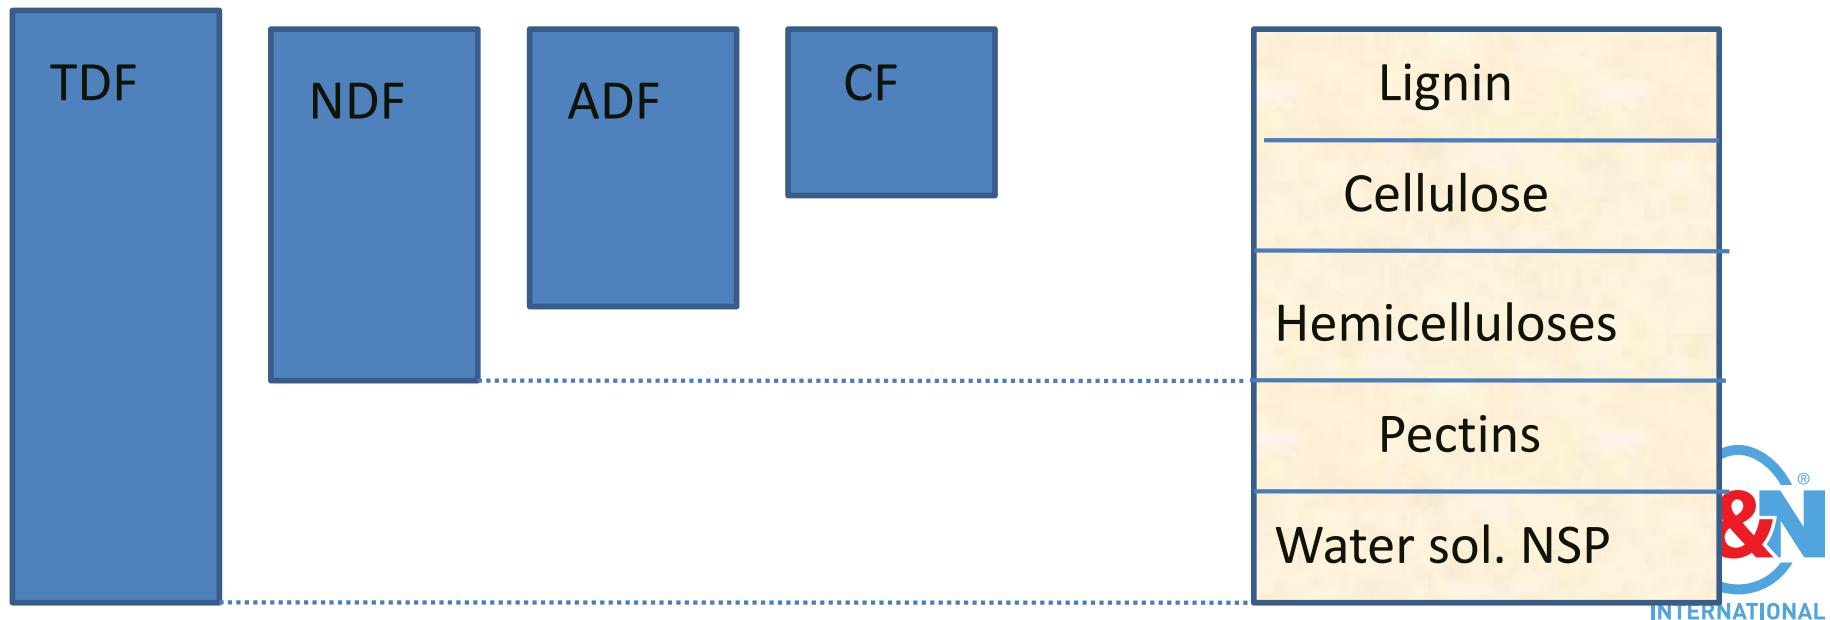

# New view of fiber

- Improves the gizzard activity
  - Increases the production of CIH, bile and enzymes
  - Increases the intensity of the reflux and improves the mixing of the digesta
- Control feed intake
  - Control of the digesta flow
  - Reduces the hyperphagia and increases the digestibility of starch
- Improves digestion of nutrients
  - Protein and minerals

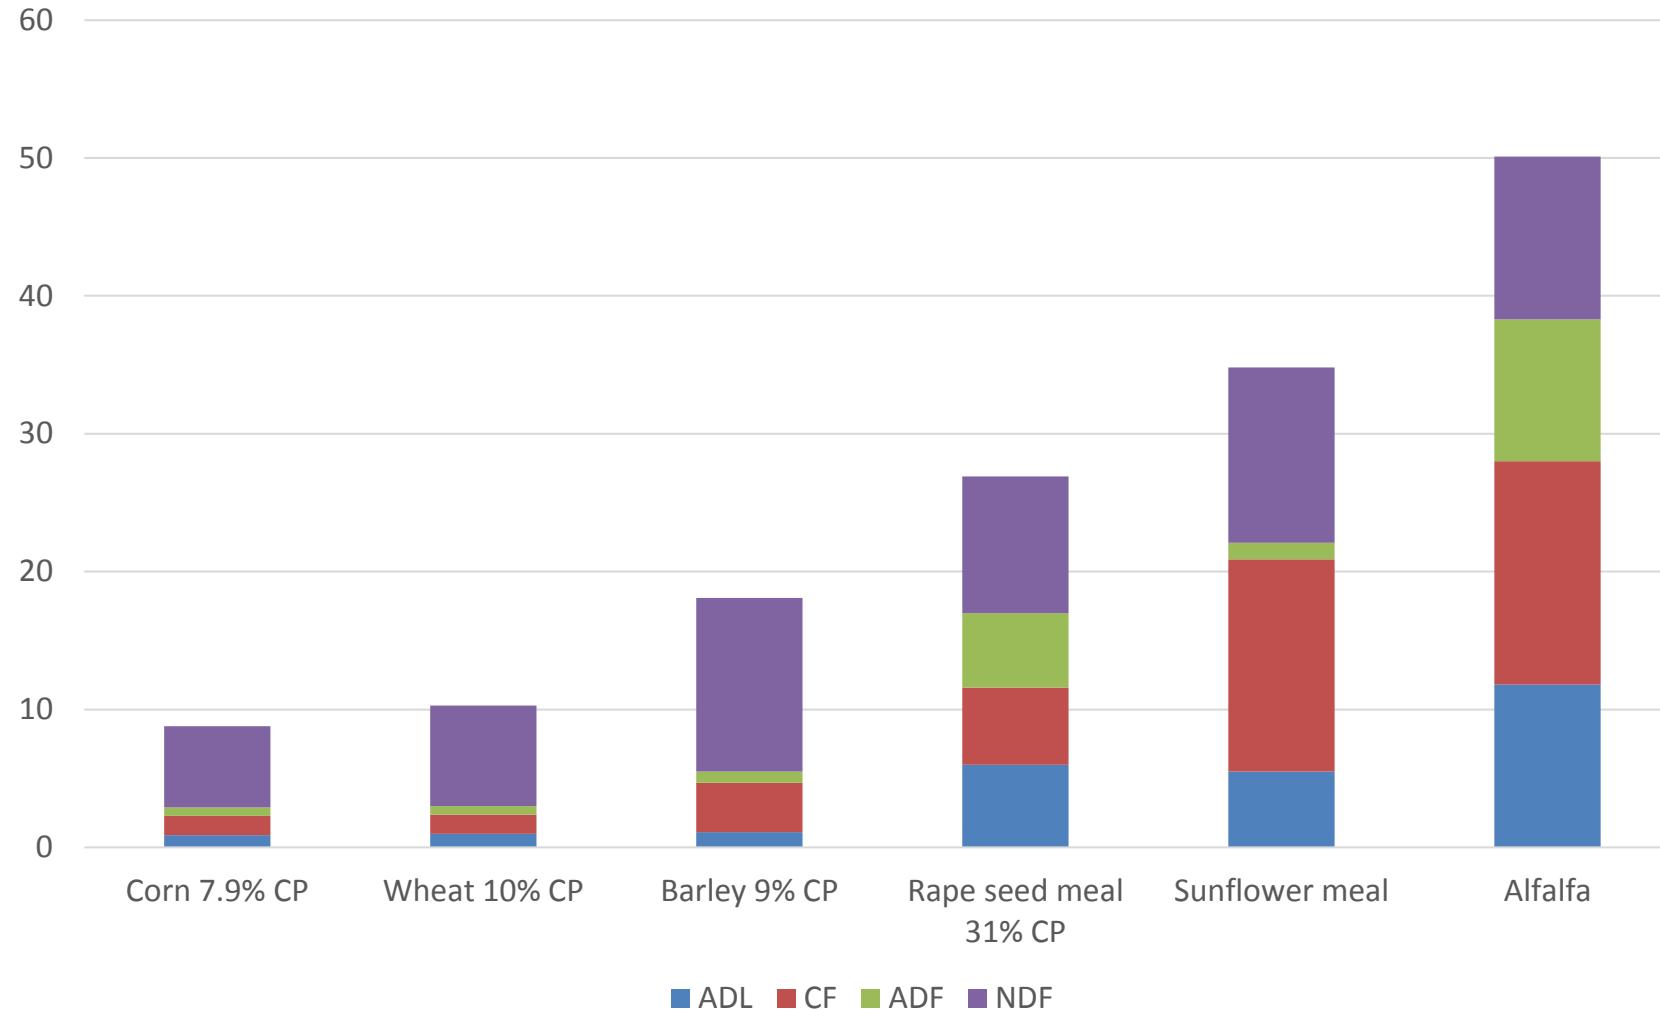

# What is the fiber

- Total Dietary Fiber (TDF)
  - Neutro Detergent Fiber (NDF)
  - Acid Detergent Fiber (ADF)
  - Crude fiber (CF)
  - Acid Detergent Lignine (ADL)

# Fiber in the raw materials

# How much fiber is needed?

- Layers aren't really fiber deficient
- The fiber is a solution to a nutritional deficiency
- Is it easier to increase the fiber than finding the deficiency?

# Sodium

- Factors of feather pecking
- Levels of 0.17-0.18 % Na
- Keep the balance with the others Cl, K  
(and S)

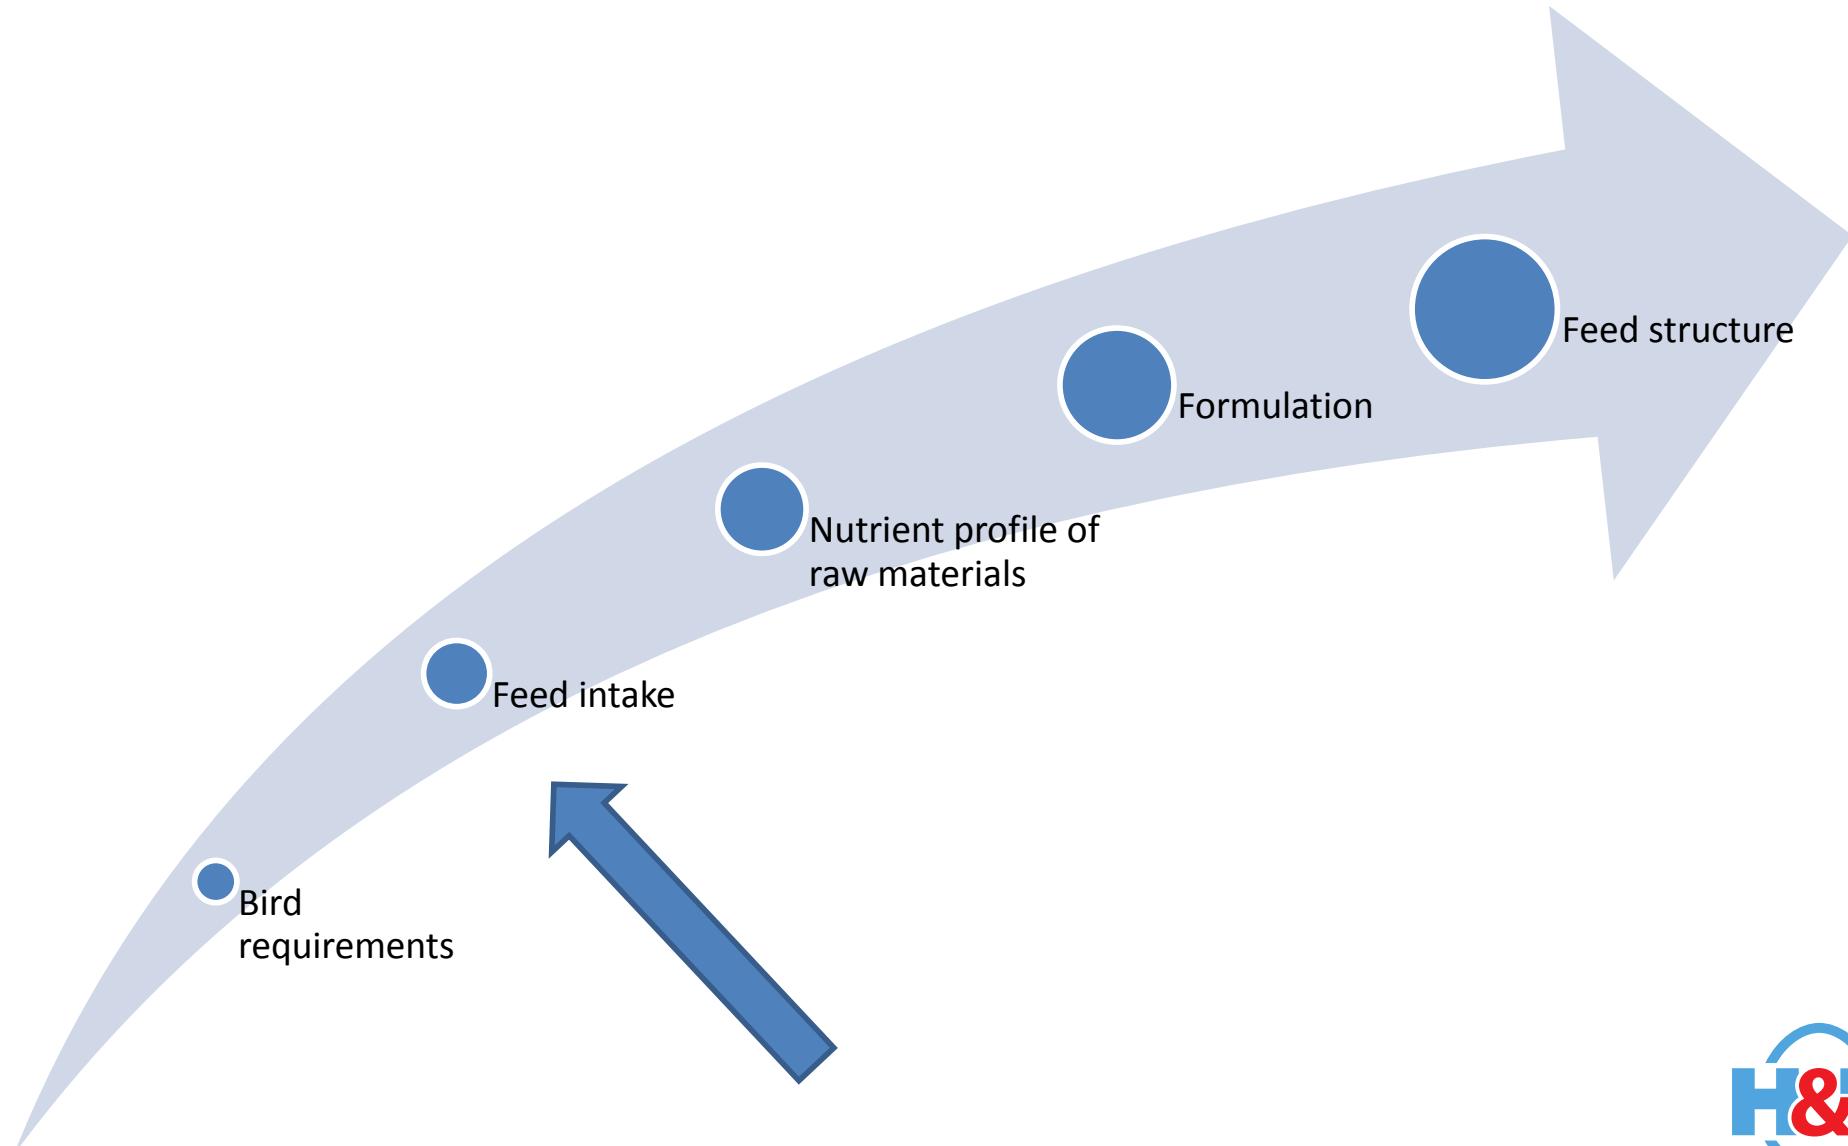

# Is really the sodium?

- How much is the mixing time?
  - How much is the CV of the mixer?
  - What was the last time the mixing CV was tested?
- Are the birds eating the all the fines?

# 5 steps in feeding

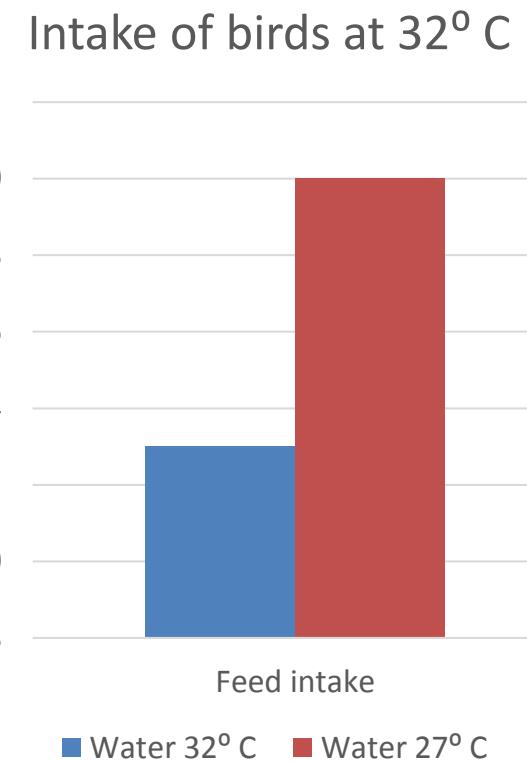

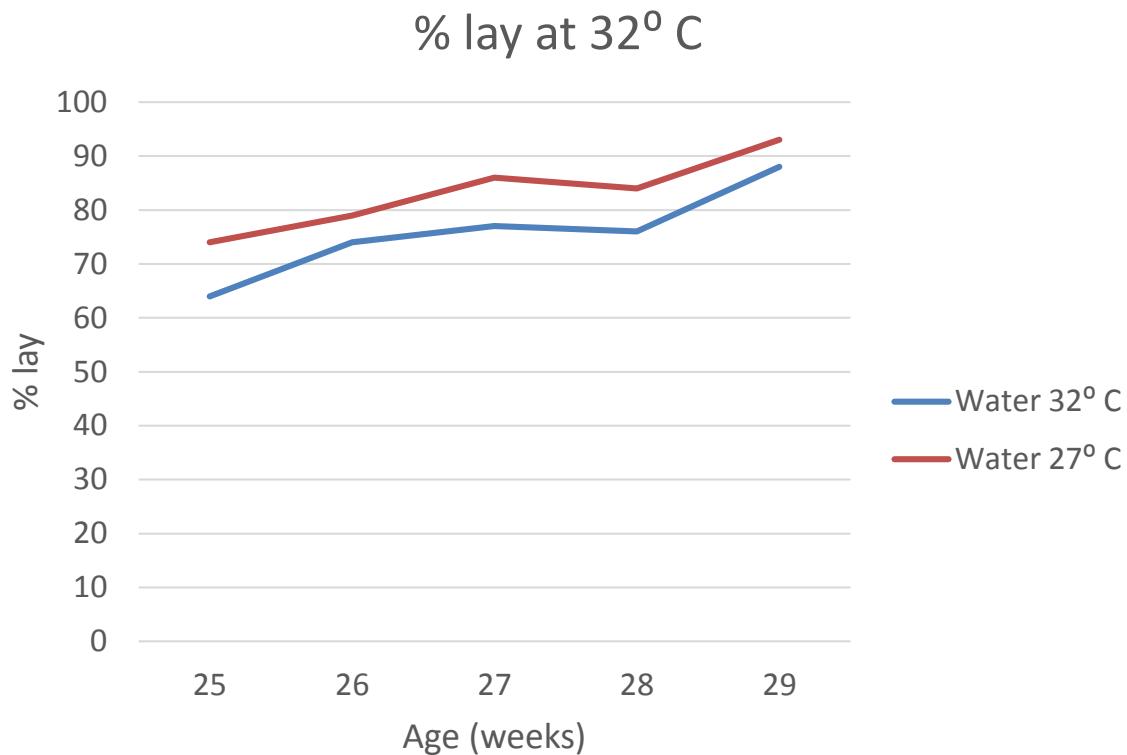

# European trend

	hen / day	Intake		
		115	120	125
MEn	329	2,861	2,742	2,632

Arg Dig	865	0.752	0.720	0.692
Val Dig	726	0.632	0.605	0.581
Ile Dig	664	0.577	0.553	0.531

# No water no feed

# 5 steps in feeding

# Ecological raw materials

- Raw material challenge
  - Non GMO
  - Variability of the composition
  - Other contaminations?
- Additives challenges:
  - Synthetic amino acids
  - Vitamins restrictions
  - Coccidiostats not allowed
- Different legislations

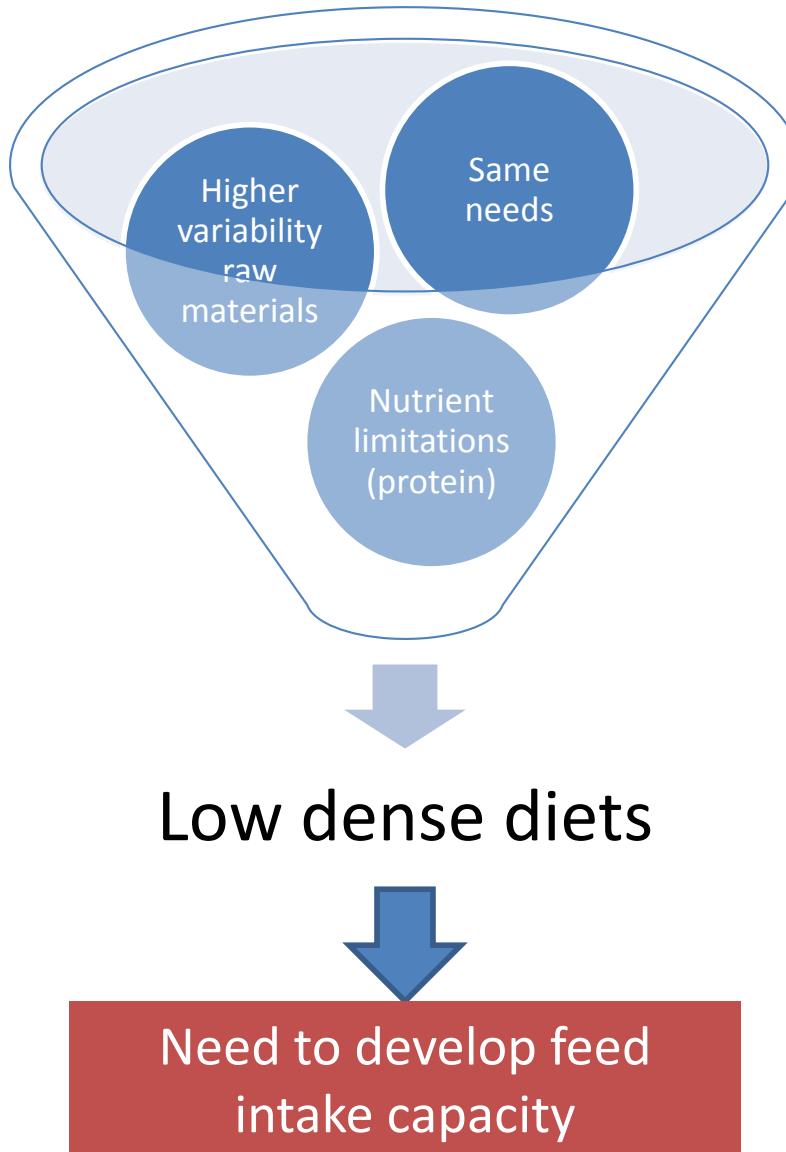

# Ecological raw materials

- Additives can be used:
  - Enzymes that aren't GMO
  - Antioxidants: naturals like tocopherols
  - Preservatives: sorbic and citric acid

# Find the strategy

# Example of a diet

	%
Crude protein	16.20
Crude fiber	6.40
Crude fat	5.5
Lys total	0.75
Met total	0.32
Energy	2.555*
Calcium	3.90
Phosphorus	0.62
Sodium	0.16

	%
Wheat	27.05
Sunflower meal	6.40

# 5 steps in feeding

# Added fat effect

Fat inclusion	1.1	3.0	SEM
ADFI (g)	117	118	0.83
Egg prod. (%)	77.0 <sup>b</sup>	79.3 <sup>a</sup>	0.84
FCR (kg/kg)	2.36 <sup>a</sup>	2.26 <sup>b</sup>	0.020
Egg weight (g)	64.9 <sup>b</sup>	66.3 <sup>a</sup>	0.28

**n = 24; P < 0,05**

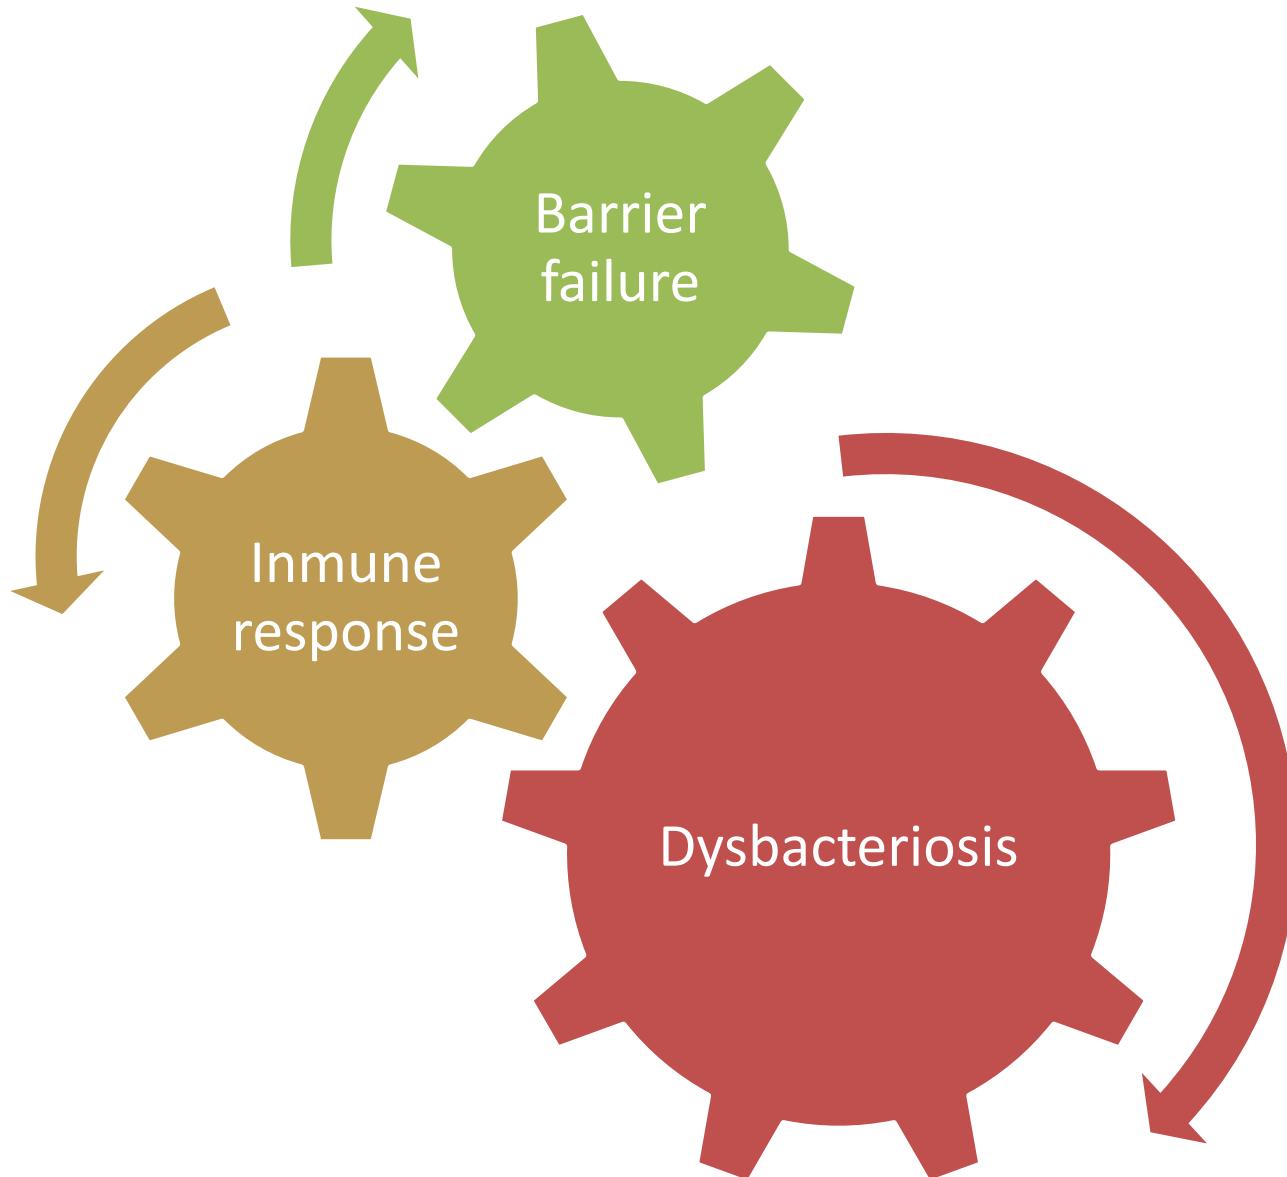

# Oxidative stress

- Vitamine E: 15-30 IU
- Vitamine A: 10000 IU
- Antioxidants
- Minerals
  - Inorganic
  - Organic

# Gut health challenge

# Dysbacteriosis

- Change of the flora of the gut that usually doesn't grow in that area
- Related to:
  - Feed contamination
  - Reduction of the digestibility:
    - Low digestible raw materials, carbohydrates or protein
    - There will be an increase of nutrients for growth
    - There will be an increase of the fermentation in the ileum
  - Disbalanced Na+K-Cl-S

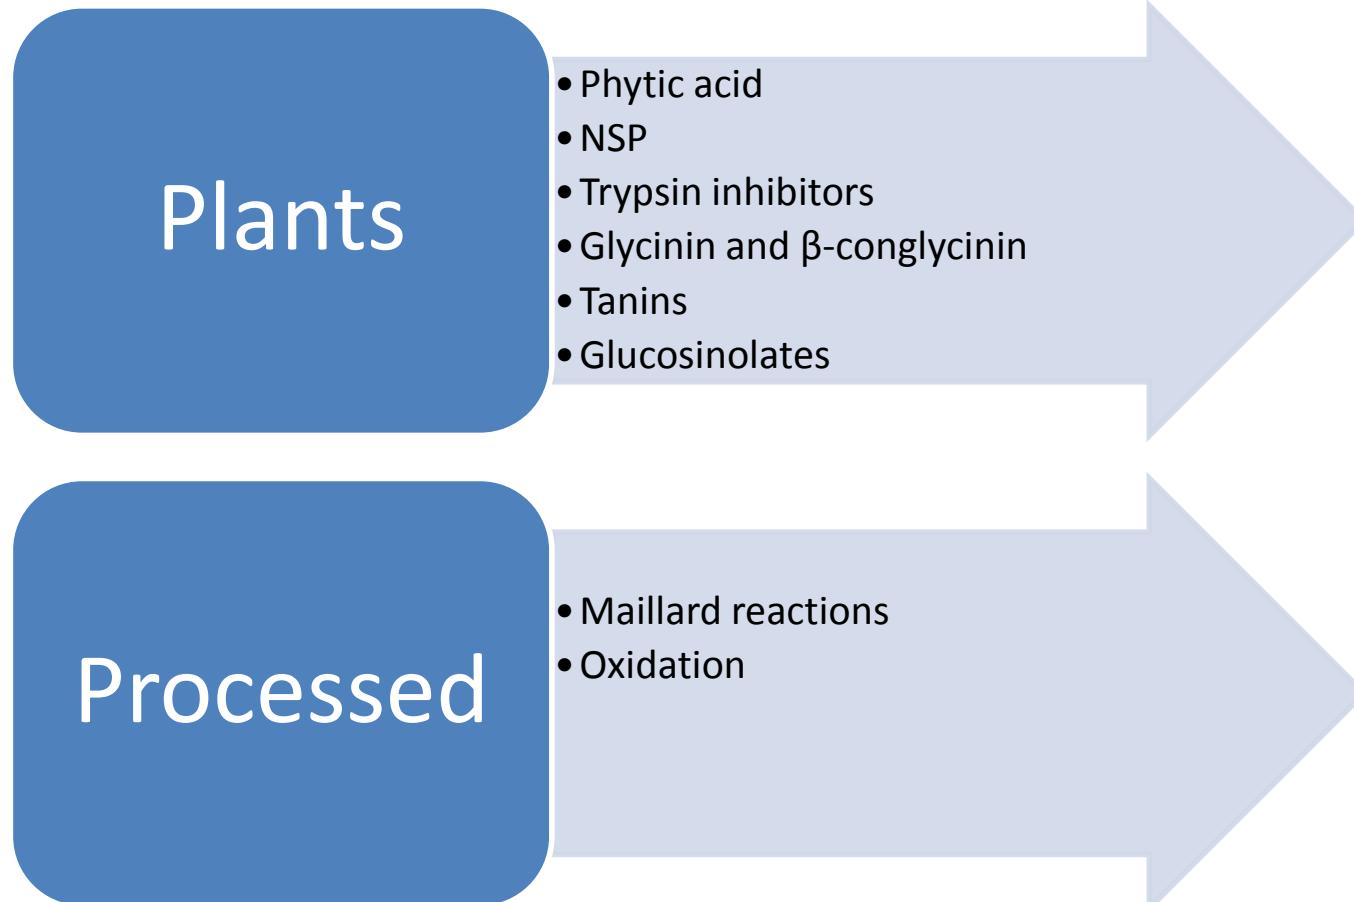

# Feed quality

	Max E.coli (log CFU)	Max. Clostridium (log CFU)	Average Salmonella (%)
Soya meal	2.08	3.69	9%
Brans	2.48	3.48	13%
Rapeseed meal	2.30	2.15	12%
MBM	-	-	15%

	Enterobacteria (log CFU)
Wheat	3.5
Corn	2.48

# Antinutritional factors

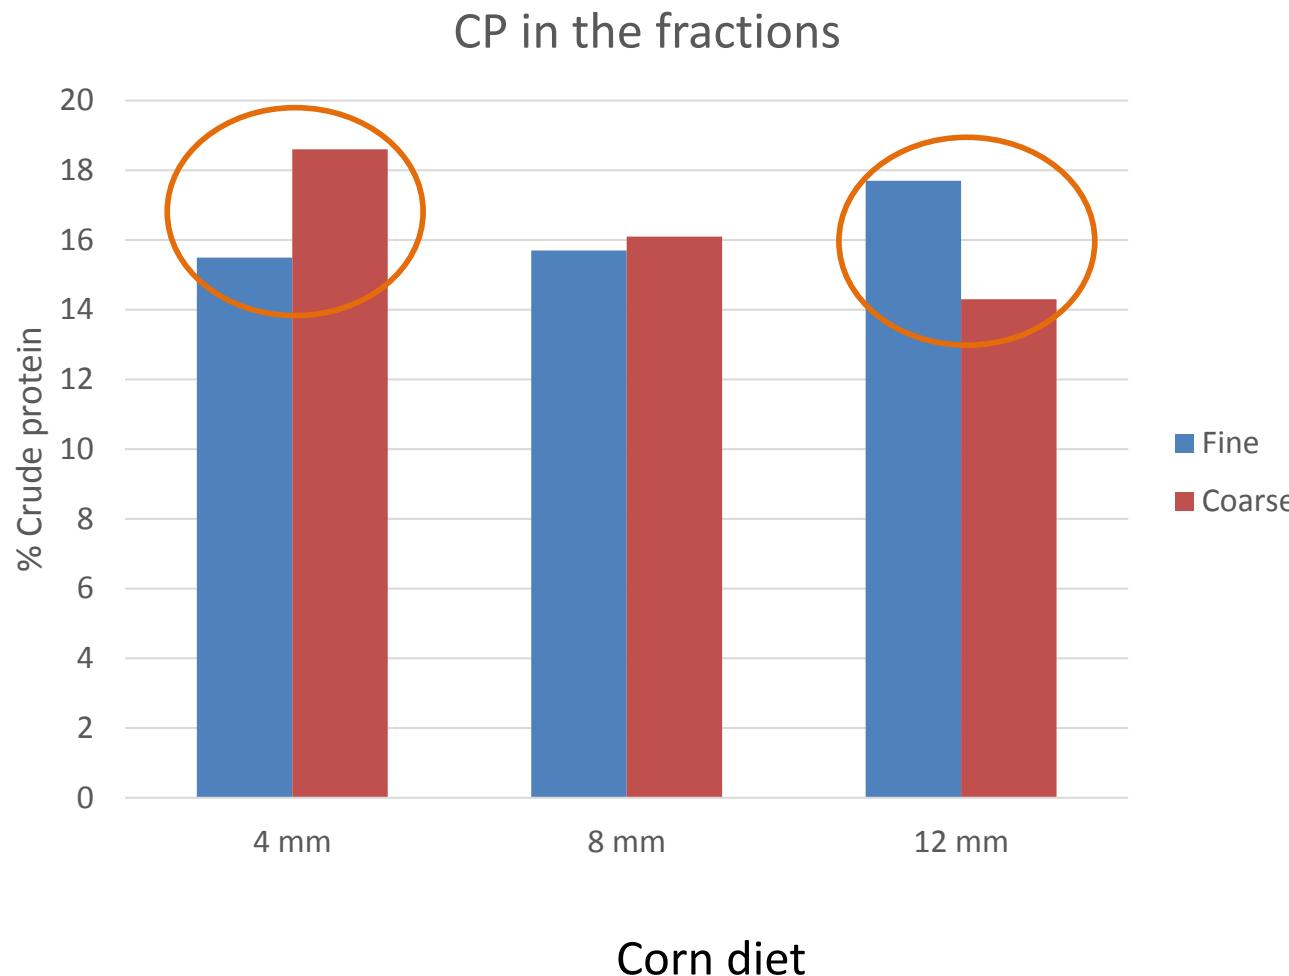

# 5 steps in feeding

# Uniformity

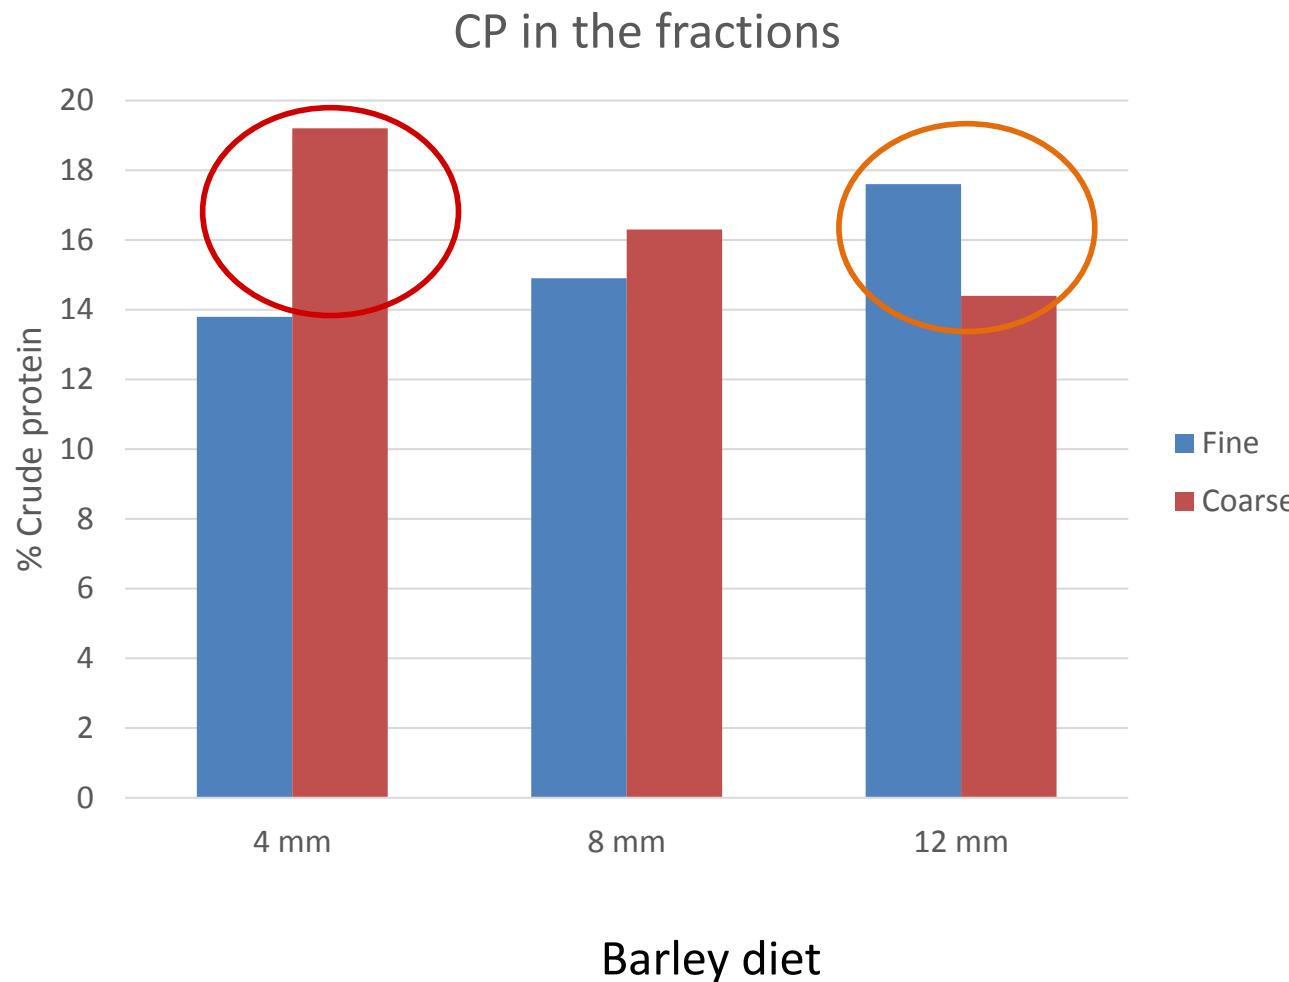

# Composition of feed

Adapted from Herrera et al  
Poultry Science 97, 2018

# Composition of feed

Adapted from Herrera et al  
Poultry Science 97, 2018

# Controls

Pullets	Average %
> 2 mm	28.28
> 1.4 < 2mm	24.55
> 1 < 1.4 mm	12.82
> 0.71 < 1 mm	9.9
> 0.5 < 0.71	8.8
< 0.5	15.66

Layer	Average %
> 2 mm	26.26
> 1.4 < 2mm	30.3
> 1 < 1.4 mm	14.49
> 0.71 < 1 mm	9.09
> 0.5 < 0.71	7.13
< 0.5	12.69

# Summary

- The needs change because there are new challenges
- Get the right feed intake should be a target
- Feed milling becomes a big part of the success of the feed
